Clock In · Solana Mobile × Radiants

Kobo

Get paid in digital dollars.

A till on an Android phone for Nigerian shops: type the price in naira, show one QR, see Paid.

The problem

Shops in Nigeria that want dollars take them the hard way today:

a wallet address pasted into WhatsApp.

No amount. No confirmation. No receipt.

A screenshot can be faked. Checking a wallet by hand for every sale does not work behind a counter.

What Kobo is

Type the price. Show the QR. See Paid. Close the day.

1 Type the price in naira

Kobo pulls the naira rate from two public sources and works out the USDC itself, rounded up to the cent.

2 Show one QR

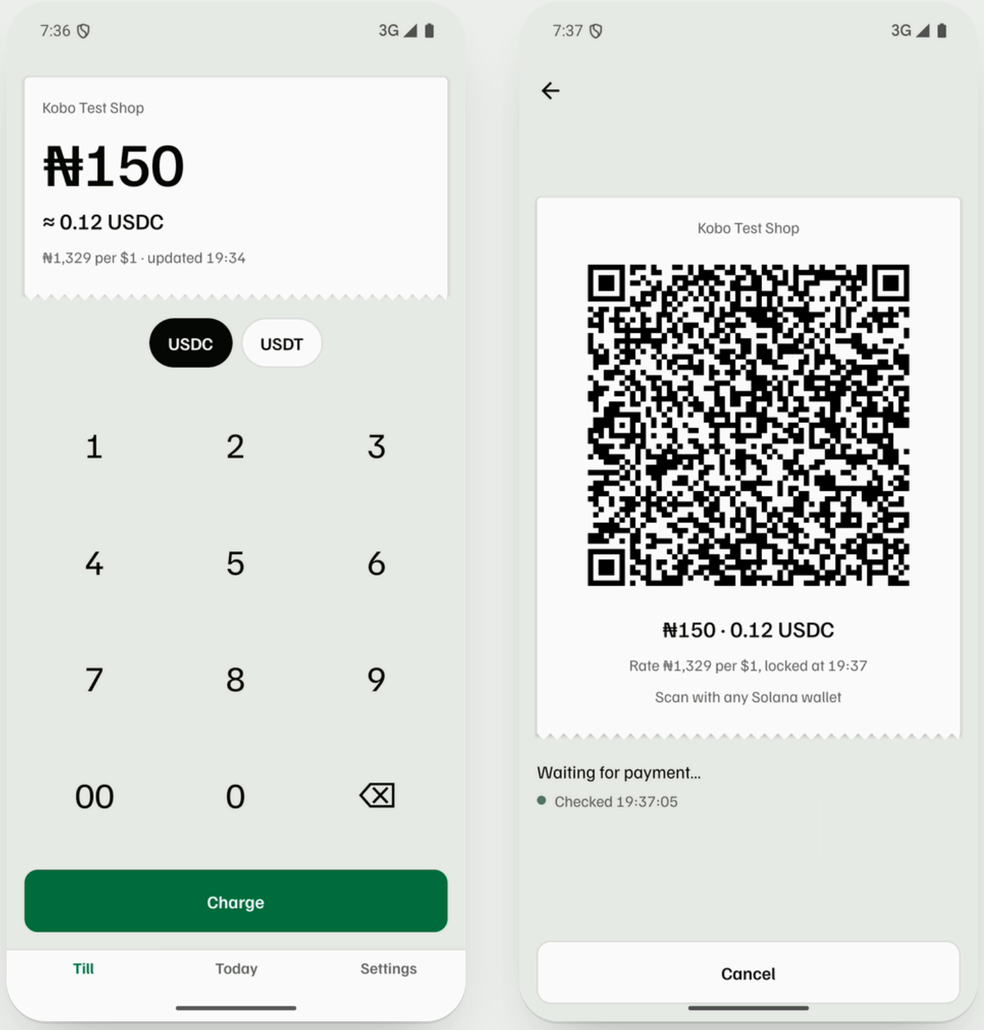

A Solana Pay link with the amount, the USDC coin and a fresh one-time reference for this sale. The rate is locked the moment the QR appears. A customer on WhatsApp gets the same request as a link.

3 See Paid

Kobo watches Solana for that reference, or for that exact amount when the wallet drops it, reads how much USDC the shop actually gained, and prints the receipt: Paid, Underpaid or Overpaid.

4 Close the day

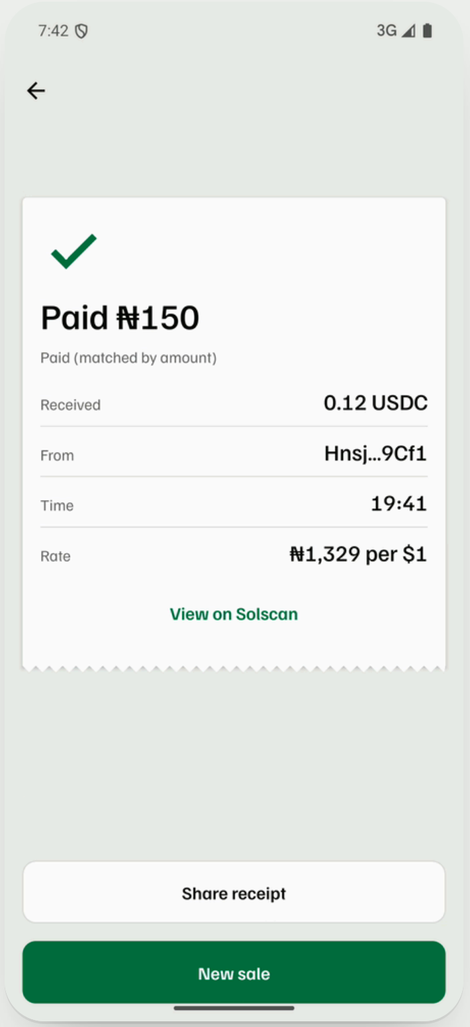

Every sale on one roll. At close, customers who paid from a Seeker phone are lined up for an SKR reward in one batch.

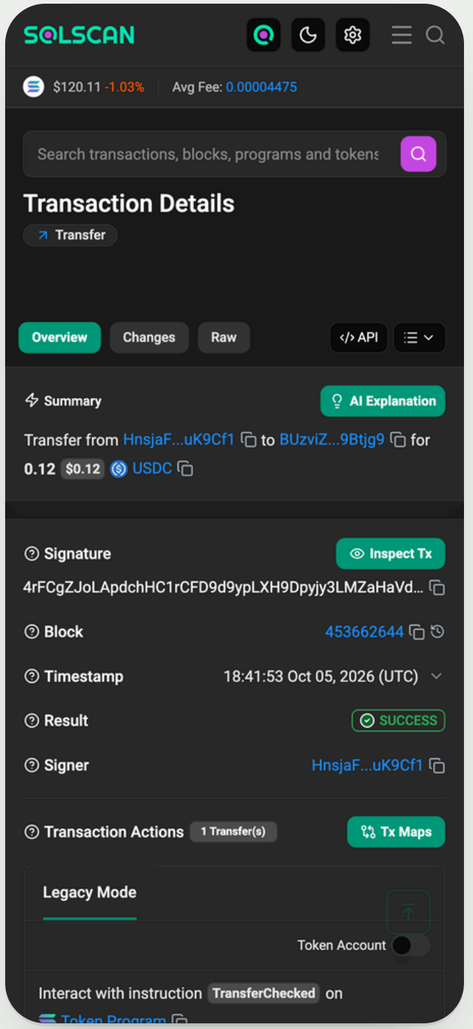

The receipt is the proof

Kobo never touches the money.

- USDC goes straight to the shop's own wallet. Kobo holds nothing and converts nothing.
- Every receipt links to the payment on Solscan. Share it to WhatsApp; anyone can check it.
- The rate line shows the source and the time it was locked, so nobody argues about it later.

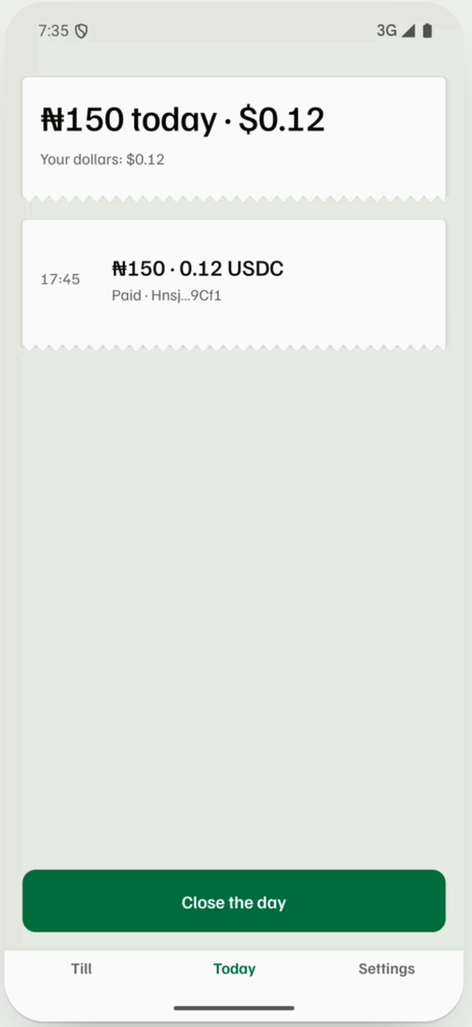

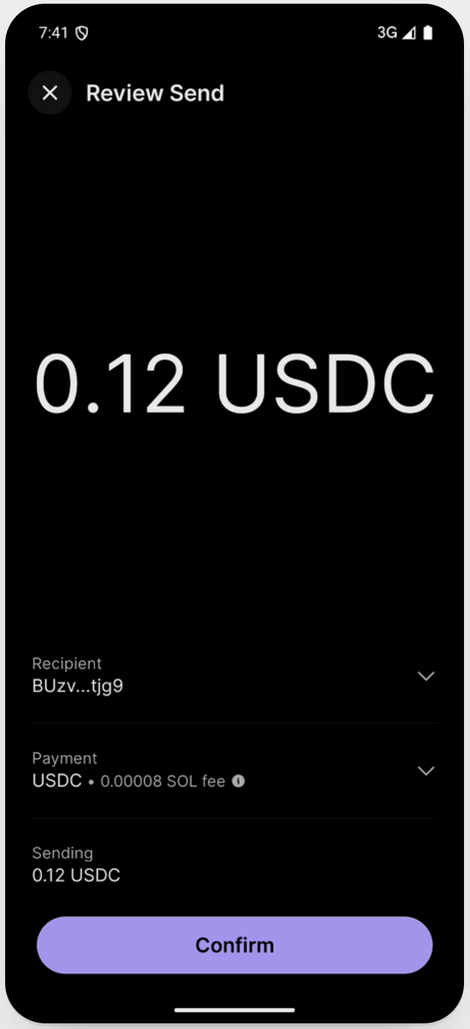

Built on Solana Mobile

The shop's own wallet signs everything.

- Mobile Wallet Adapter: the shop connects its wallet once; the till stores no private key. Refunds and the daily reward batch go out as one approval.
- Seeker Genesis Token: a payer from a Seeker phone is spotted on chain and lined up for SKR back at the daily close. One reward per Genesis Token per shop per day.
- Solana Pay: one fresh reference key per sale, matched on chain, never by screenshot. If a wallet drops it, Kobo matches the exact amount and says so on the receipt.

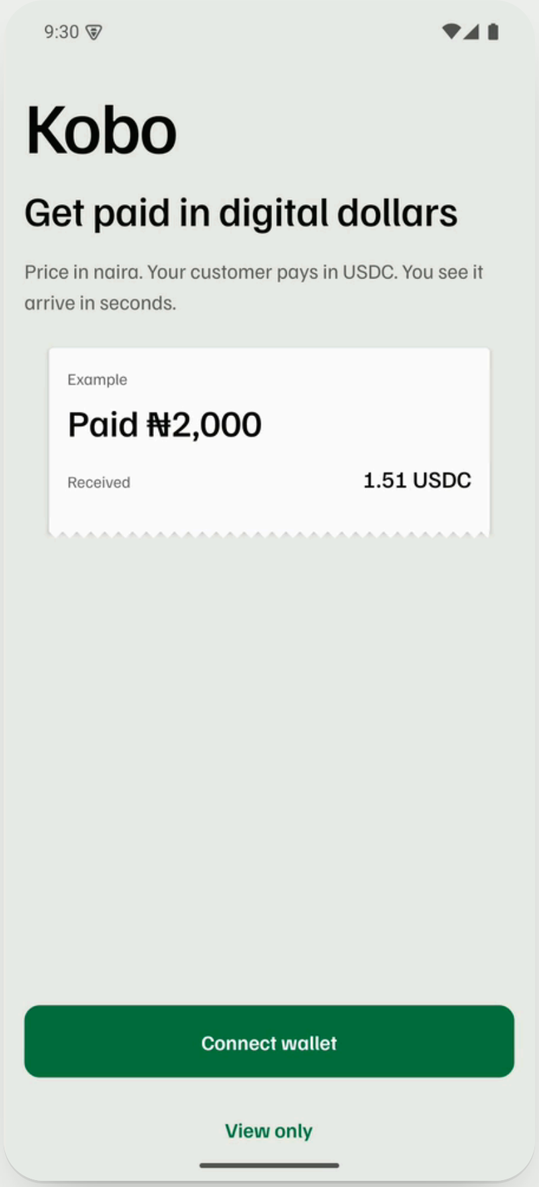

Who asked for this

Solana Mobile posted the request. Shops have the need.

- Solana Mobile asked for an Android-first crypto point of sale and for Scan and Pay for merchants on superteam.fun (both posted 2025-10-14).
- First shops: phone, electronics and fashion sellers who already pay overseas suppliers in USDT or USDC, and vendors at Superteam Nigeria events.
- Stablecoins were 43% of Sub-Saharan Africa's crypto volume (Chainalysis, October 2024). How many shops want dollars at the counter is the open question; ten in-person conversations are being logged.
- Nobody sells this yet: Solana's own point-of-sale example was retired in March 2026, and the Nigerian options that exist (StableFlow, Quidax) hold the money and settle naira to a bank. Kobo holds nothing.

Where it stands

What is real today, and what is not yet.

Naira price to a USDC Solana Pay QR	Real. Unit tests; the QR on the phone decodes to the expected link.
Paid detection	Real on mainnet: the receipt printed within seconds of the payment's block. Underpaid and part payments ran on a local network.
Reading real mainnet payments	Real. The app's code read a real USDC transfer on mainnet, including a version 1 transaction.
Seeker phone check	Real on mainnet against the Solana Mobile docs' example owner.
A real wallet paying a Kobo QR on mainnet	Done with Phantom (2026-10-05 and 06): 0.12 USDC each, Paid within seconds. Phantom keeps the coin and amount but drops the reference; Kobo matches by amount.
Refund signed by a real wallet	On devnet, 2026-10-12: a USDC refund on a durable nonce, signed through Mobile Wallet Adapter. Not yet on mainnet with Phantom.
SKR reward signed by a real wallet	Not yet. The maths ran on the local network; the send needs the wallet test.
A physical Android phone	Not yet. Every run so far is on Android emulators with Google Play.
Tap to pay (NFC)	Not built.
A customer with USDC on Solana	Not assumed. MiniPay, Africa's biggest stablecoin wallet, is on Celo. Kobo needs Phantom, Solflare or the Seeker wallet.

After the deadline

The till keeps running whether or not it places.

2026-10-05	First real USDC payment into Kobo on mainnet, paid from Phantom, recorded for the demo
2026-10-12	Ten in-person shop conversations logged, phone and electronics sellers first
2026-10-19	First shop that is not the founder takes a real payment on Kobo
2026-10-31	Decide: keep going toward a Play Store listing, or write the post-mortem

Kill test: if fewer than 3 of the first 10 shops would rather receive USDC than naira, Kobo rescopes to crypto-event vendors only.
